

System and hardware requirements: Windows 10 or 11 operating system, and an Nvidia RTX series graphics card (e.g., RTX 3060, 3080, 4060, 4070, 4070 Ti, 4080, 4090, etc.).

Open the **BDFM-Vis.exe** file located in the **Demo** directory to launch the user interface. Note that the directory containing the **Demo** folder must not include spaces or non-ASCII characters; otherwise, files cannot be saved properly. The same restriction applies to the directory containing the test data.

The test data consists of **.raw** (raw data files) and **.info** (data information files). To visualize the data, simply drag and drop the **.info** file into the interface.

The segmentation code includes a program that automatically generates **.info** files.
